

Protect your Sago Palms

- Asian Cycad Scale, also known as ACS, is an insect that damages Sago Palms by inserting its mouthparts and feeding on the plant, causing it to decline.
- This very small pest (less than 1/8 inch) will infest the fronds, crown and even the roots of Sago Palms causing **death** if left untreated.
- Both topical and systemic treatments are performed to control this pest.
- Curative treatments are available to control active infestations of ACS.
- Preventive treatments are available to protect your sagos from becoming infested.

Above: Sago Palm with severe ACS damage

Asian Cycad Scale is commonly found on the lower portion of the fronds. However, if left untreated it will cover the entire plant causing death to the palm.
